

**DON'T JUST GET CLEAN/SOBER.**  
Get Well.

Fifty years ago the scientific and medical communities didn't know as much about addiction and the brain as they do today. Part of what we've learned is that addiction is a chronic and progressive disease that resides deep in the brain. And just like other chronic diseases such as diabetes, asthma or high blood pressure, we can now manage addiction with appropriate medications and a comprehensive, evidence-based approach.

These medications and new approaches provide tremendous hope for patients and their families by drastically increasing their chances for long-term success, and by educating others that overcoming addiction is not about a lack of will power, a lack of faith or a lack of discipline. It's about addicts' brains being physically unable to circumvent certain neurological pathways.

Science has proven that by using these anti-addiction medications, we can give the brain a chance to reboot so that it can begin to rewire its neurological pathways. At Enterhealth, we can do more than just get people clean/sober for today; we can begin a healing process that will last for the rest of their life.

### HOW IT'S DIFFERENT is why it works.

Unlike other programs, Enterhealth treats addiction like the chronic disease that it is, using the latest scientific breakthroughs and anti-addiction medications. These anti-addiction medications, when combined with evidence-based behavioral therapies, have proven in numerous studies that they can:

- Block the effects that alcohol and/or drugs cause within the brain (e.g. block the ability to get “high”/“drunk” or the euphoria)
- Significantly decrease cravings for the addictive substance
- Significantly decrease the physical effects of addiction withdrawal
- Help to heal the brain damage caused by past alcohol and/or drug usage

Science has also learned that there are numerous levels of addiction within the brain. Our newer treatment approaches are tailored to address each person’s addiction level, abuse patterns, and co-occurring medical, psychiatric and social problems, and are proven to be the best path to sustainable recovery and a life without addiction.

Dual diagnosis is a term used to describe a person suffering from a substance abuse problem combined with a psychiatric illness/condition (depression, anxiety, mania, bipolar or psychotic disorder). Making a dual diagnosis in addicts is often difficult because alcohol and/or drug addiction itself often induces psychiatric symptoms, thus making it necessary to differentiate between substance-induced issues and pre-existing issues. Enterhealth’s addiction treatment experience incorporates scientifically validated modalities and techniques that cannot readily be obtained at a lower level of care, including:

- Intensive One-on-One Patient Therapy
- In-depth Family and/or Spousal Therapy
- Motivational Interviewing
- Motivational Enhancement Therapy
- Trauma Resolution
- Pain/Anxiety Management
- Neuro-therapy
- Broad Spectrum Alcohol Treatment
- Opiate Addiction Treatments
